

CPLANE SURVEYOR

Infrastructure and
Application Discovery
and Dependency
Mapping

Bridging the gap

Unparalleled Application Integrity

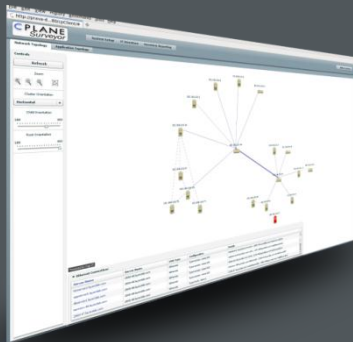

Today's applications are more demanding

Applications growth, both in numbers and complexity, is accelerating at a never-before-seen rate. Architectural changes introduced by different cloud architectures along with increased demands for portability and disaster recovery are stretching the limits of traditional application management tools. Application managers need a tool that allows them to spend less time monitoring application configurations and more time focusing on application functionality. Historically application managers have relied on a loosely connected set of federated tools to identify, capture, report and manage application configurations.

CPlane Surveyor in conjunction with CPlane's unique and powerful IT **Discovery** tool takes the headache out of creating and maintaining your application portfolio.

CPlane Surveyor delivers:

- Accurate up-to-date application topology information
- Automatic detection and notification of changes
- Identification of problems outside the manager's sphere of responsibility
- Early detection and warning of problems
- Faster problem identification and resolution
- Continuous improvement identification

CPlane Surveyor benefits

- Up to 80% time saving in tracking and managing applications
- Up to 50% savings in compliance procedures and audits
- Significantly improved problem resolution through fast cross-organization correlation
- Automatic documentation creation
- Increased assurance of production,
- QA/Test and DR configuration equivalency
- Identification and reduction in unauthorized changes
- Error identification and detection
- BEFORE they cause problems
 - Hardware refresh
 - Physical to Virtual conversions
 - Changes in other department or external assets
 - CMDB updates
 - Changes in application components
 - Disaster Recovery contingency plans

Discovery

Agentless drop and go deployment with automated discovery and change detection for all service delivery architectures

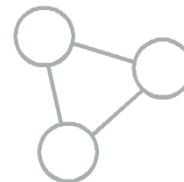

Device Library

Fully extensible device and element library to cover all infrastructure, application and cloud models

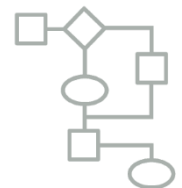

IDE

Integrated feature-rich development platform for the creation of value-added business and management add-ons

Correlation

360° multi-level view of your application ecosystem for unprecedented visibility and control

Workflow

Policy-based workflow with full roll-back for unmatched control and management of all service delivery functions

Immediate Business Impact

A new view of applications

CPlane Surveyor creates a new perspective of your applications and the relationships that exist between all the components of the application ecosystem. Unlike the traditional “infrastructure component” view that most products provide, Surveyor enables application managers to create a complete topology map of an application, including both upstream (those served by the application) and downstream (those that serve the application) resources. With this 360° view application managers now have complete visibility to the status of all the resources that support their application – those under their direct control as well as those outside their direct control.

Lean IT with immediate payback

No agents. No infrastructure changes. Installs in about an hour. Frictionless...

The CPlane framework comes as a virtual appliance that you can non-disruptively drop into your environment and immediately realize the benefits of having complete insight and control of your application configuration management. It takes only **three** easy steps:

- 1 Install Surveyor (with CPlane Discovery)
- 2 Enter environment parameters (e.g., IP ranges, user credentials) and run component discovery
- 3 Identify application components and dependencies

CPlane Surveyor use cases

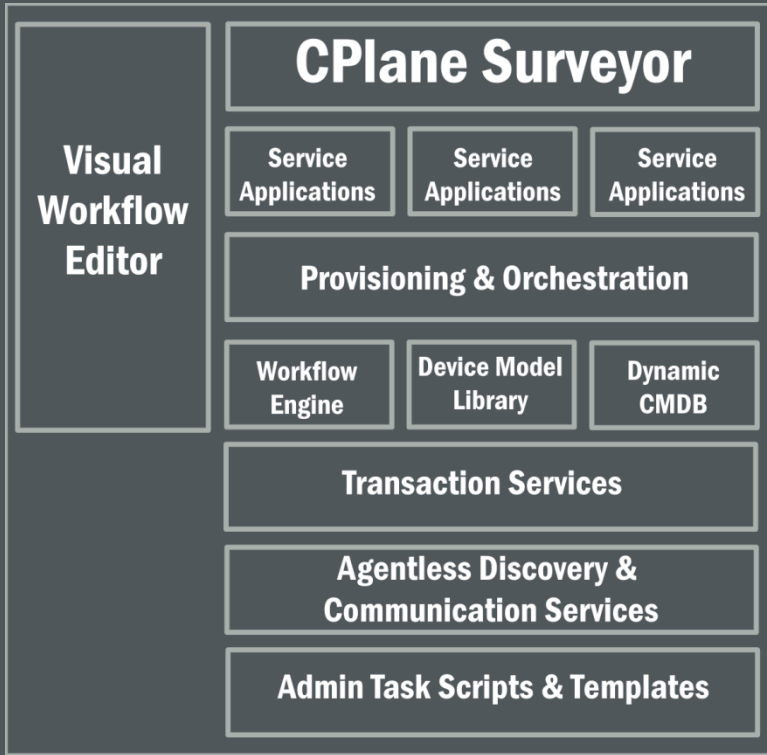

- Business application configuration and relationship modeling and monitoring
- Change detection and notification
- Configuration verification during planned changes
- Application problem root cause determination
- Auditing and compliance reporting
- Service assurance and application integrity

= 360°

CPlane Surveyor provides a level of business context that allows my clients to understand the key relationships between their mission critical applications and the IT infrastructure that enables them. The 360 degree, multi-level view that Surveyor provides helps eliminate the traditional siloed view of applications – and finger pointing when problems arise...

Tim La Fazia – CEO, Infrastructure Development Corporation

About CPlane

The CPlane Architecture

CPlane is the flagship product of **LAYERZngn LLC**. Building upon a rich framework developed for the demanding telecommunications industry, LAYERZngn is the first company with comprehensive solutions for enterprise data center and cloud computing **Infrastructure and Application Discovery and Dependency Mapping (IADDM)**.

Designed for frictionless deployment, seamless integration and zero impact, CPlane Surveyor is the industry's most comprehensive application ecosystem discovery, correlation and management platform. With Surveyor application owners and IT departments now have a common view of your enterprise's most critical assets – your **business applications** and the infrastructure that supports them.
